Application/Control Number: 10/017,006 Page 2

Art Unit: 2616

1. Claim 1 recites the limitation "the web server" in lines 6-7. There is insufficient antecedent basis for this limitation in the claim.

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1,6-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Boyle et al. (6,119,167, of the record) in view of Coffee et al (US Pub. 2006/0182055, newly cited).

For claims 1, 6-18, Boyle et al. disclose pushing and pulling data in networks comprising: a web server component (see box 130.1-130.2 in figure 1) for storing data and for generating internet messages; a communications interface operable to convey internet messages to and from the web server using a wireless digital packet network (see box 134 in figure 1; wherein said web server and said communications interface are connected to each other (see box 126 in figure 1); wherein said communications interface is operable to transmit and receive said internet messages on a cellular digital packet network (see column 3 lines 27-39); wherein said communications interface is operable to receive Transmission and Control Protocol (TCP/IP) messages from said web server for transmission on said wireless digital packet network (see column 3 lines 25-29); wherein said communications interface comprises a wireless transceiver for

Application/Control Number: 10/017,006

Art Unit: 2616

Ĩ

transmitting and sending said internet messages on said wireless digital packet network (see wireless network 125 in figure 1); wherein said web server is operable to receive and store data to be served (it is inherent that the server has memory for storing data); further including an input interface operable to receive a signal from a sensor and produce a data representation of said signal, for storage as data to be served by said web server(see box 122 in figure 1); receiving a data request message from a wireless digital packet network (see requesting in figure 31); requesting data from a wireless web server in response to said data request message(see service reply in figure 31); and transmitting on said wireless digital packet network a response message including data produced by said wireless web server in response to said data request message(see service reply in figure 31); further comprising extracting a Transmission and Control Protocol (TCP/IP) message from a wireless digital packet network protocol message (see column 3 lines 27-39); further comprising transmitting said TCP/IP message to said wireless web server(see column 3 lines 27-39); further comprising inserting a Transmission and Control Protocol/Internet Protocol (TCP/IP) message from said wireless web server into a wireless digital packet network protocol message for transmission on said wireless digital packet network(see column 3 lines 27-39)and box 126 in figure 1)); transmitting a message on a wireless digital packet network for use by a wireless web server operable to receive messages from said wireless digital packet network (see box 126 in figure 1); wherein transmitting said message comprises producing a wireless digital packet network message containing a Transmission and Control Protocol/Internet Protocol (TCP/IP) message(see column 3 lines 27-39); and

Application/Control Number: 10/017,006 Page 4

Art Unit: 2616

further comprising receiving, from said wireless digital packet network, a message produced by said wireless web server(see wireless network 125 in figure 5). Boyle et al do not specifically disclose a wireless web server with a wireless communications interface. Coffee et al disclose a wireless gateway comprising a wireless web server with a wireless communications interface (21 of fig. 1). Therefore, it would have been obvious to one skilled in the art to use a wireless web server with a wireless communications interface as taught by Coffee et al in the system of Boyle et al in order to provide the communication wirelessly.

- 4. Applicant's arguments with respect to claims 1,6-18 have been considered but are most in view of the new ground(s) of rejection.
- 5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to AJIT G. PATEL whose telephone number is 571-272-3140. The examiner can normally be reached on MONDAY- FRIDAY.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wellington Chin can be reached on 571-272-3134. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the

Patent Application Information Retrieval (PAIR) system. Status information for

published applications may be obtained from either Private PAIR or Public PAIR.

Status information for unpublished applications is available through Private PAIR only.

For more information about the PAIR system, see http://pair-direct.uspto.gov. Should

you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a

USPTO Customer Service Representative or access to the automated information

system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
